

LEORIX — Website Structure Specification

Scope of this document: site architecture only — page tree, navigation, homepage module sequence, and the structural slots the brand positioning requires. Copy, imagery, product designs, and claims are explicitly out of scope and to be written later. This is a build hand-off, not a content brief.

Positioning the structure must serve: design-led, engineering-backed, measurable performance. Proof before product. Every structural decision below follows from that.

0. The one decision that gates everything: Mode

The current build runs two architectures at once — a pre-launch waitlist site *and* a live commerce store. They compete. Pick the mode first; the structure below is designed for a **phased path** so you don't rebuild later.

- **Phase A — Pre-launch (now):** drop not live, FDDI validation in progress, products not finalized. Primary action = **join waitlist**. Commerce surfaces (cart, checkout, prices, discount codes) are hidden/disabled.
- **Phase B — Live commerce (at drop):** Primary action = **buy**. Waitlist block converts to early-access/membership. Commerce surfaces switch on.

The sitemap is identical across both phases. Only the primary CTA, the homepage's final section, and the visibility of commerce elements change. Build once, toggle at drop.

1. Sitemap (page tree)

HOME

SHOP

- └─ Men (real collection — must NOT route to the same URL as Women)
- └─ Women (real collection — distinct catalog)
- └─ The Vault (define role — see §4)

TECHNOLOGY ← NEW, top-level. The positioning lives here.

- └─ The Approach (engineering philosophy / how a Leorix shoe is built)
- └─ Validation (FDDI biomechanical + durability data, as it lands)

└─ Materials (component transparency – ties to "every claim verified")

ABOUT

└─ About Us
└─ Contact

PRODUCT DETAIL PAGE (PDP) ← template, applies to every product

└─ Gallery
└─ Buy box (price / size / add-to-cart)
└─ Spec & Validation module ← NEW, structural requirement (see §3)
└─ Size & Fit entry point
└─ Related products

SIZE & FIT ← NEW. Table-stakes for footwear.

└─ Size guide
└─ Fit finder / fit notes

UTILITY / LEGAL (footer)

└─ FAQ
└─ Shipping & Returns
└─ Privacy Policy
└─ Terms of Service
└─ Newsletter / Waitlist signup

Navigation notes

- **Primary nav:** Shop (Men / Women / The Vault) · Technology · About. Keep it to these three pillars. Technology earns top-level placement because it *is* the differentiator — it cannot stay buried in a homepage carousel.
- **Men / Women must be genuinely separate collections.** Today both point to `/collections/products`. The nav promises segmentation the catalog doesn't deliver.
- **Footer** carries utility/legal + waitlist. No dead # anchors — every link resolves or is removed until its page exists.

2. Homepage module sequence (proof before product)

Current order leads with products and promo banners, then buries the proof. For an

engineering-led brand, invert it: **lead with the argument, end with the product and the ask.**

#	Module	Purpose	Phase A (pre-launch)	Phase B (live)
1	Announcement bar	One message only	"First drop coming soon"	Promo / shipping msg
2	Hero	Brand statement + single primary CTA	CTA → Join waitlist	CTA → Shop
3	The Problem	Why Leorix exists (the gap it fills)	✓	✓
4	The Approach	How a Leorix shoe is engineered	✓	✓
5	Validation / Proof	FDDI data, test results, measurable claims	Teaser ("validated by FDDI")	Full proof + link to Technology
6	Hero product feature	ONE product — the hero (X)	Preview / "coming soon"	Shop the hero
7	Collection preview	Small curated set, not the full dump	Hidden or "coming soon"	✓
8	Social proof	Testimonials / partners (real, later)	Optional	✓
9	Conversion block	The single ask	Waitlist + counters	Early-access / membership
10	Footer	Utility, legal, signup	✓	✓

Principle: one hero, one primary CTA per page. Modules 3→4→5 are the argument; 6→7 are the product; 8→9 are the ask. The visitor is convinced before being sold to.

3. PDP structural requirement: the Spec & Validation module

A default theme PDP has nowhere to render "here is the lab data behind this shoe." That slot must be built, because it is where the transparency claim becomes real. Per-product,

structured to hold:

- Component / material breakdown (the spec-sheet data, made public)
- Measured performance values (hardness, density, abrasion, plantar-load results)
- Validation reference (which FDDI report backs which claim)
- Construction method
- Size & fit entry point

This module is the on-page proof for every “verified claim.” Build it as a reusable PDP section, populated per product, not a one-off.

4. Define “The Vault”

Currently a nav item with no established role. Pick one before content is written:

- **Option A — Drops archive / limited releases:** scarcity + collectibility layer.
- **Option B — Members / early-access area:** ties to the existing account system; natural home for the Phase A waitlist to graduate into.
- **Option C — The engineering/proof destination:** but Technology already does this better as a clear top-level page, so avoid overloading The Vault with it.

Recommendation: **B (early-access/membership)** — it gives the waitlist somewhere to live post-launch and reinforces the direct relationship. Decide before build.

5. Cleanup checklist (structural defects in current build)

- Remove duplicate “What Leorix Is Solving” section (renders twice — build error).
- Consolidate the two product-display modules (carousel + “Explore the Latest Product”) into one.
- Reduce three stacked “Shop Now” banners to one.
- Delete test/duplicate products (Sneaker 1–5 and their “Copy” variants) from the live catalog.
- Fix Men / Women routing to distinct collections.
- Resolve or remove dead footer links (Products, Newsletter, FAQ → currently #).

- Reset default theme metadata ("My Store" title, template attribution, 2020 copyright, placeholder contact block) — structural leftovers, not content.
-

6. Build priority order

1. **Pick the mode** (Phase A vs B) — gates everything.
2. **Re-sequence the homepage** to proof-before-product (§2).
3. **Run the cleanup checklist** (§5) — remove duplicates, test products, dead links, fix gender routing.
4. **Build the missing structural homes:** Technology page (§1), PDP Spec & Validation module (§3), Size & Fit system (§1).
5. **Define and scope The Vault** (§4).

Content, imagery, and product designs slot in *after* this skeleton is correct.
